Abstract The Organizing Committee of SmartCom 2019 provides a \LaTeX class file and a sample source file for the paper submitted to Poster Sessions and Special Sessions of the workshop as “TYPE-1 (Isshu-ken) Paper.”

Key words \LaTeX , Paper Template, Poster Sessions, Special Sessions, Invited Lecture, TYPE-1 (Isshu-ken) Paper

1. Informations for Author(s)

All papers must be written in English with a maximum paper length of eight (8) printed pages including figures. The paper size should be A4 and the text should be typed in two-column single-spaced format. The first page should include the title, each author's information (name, affiliation, mailing address, e-mail address), an abstract of 100 words, and a few keywords. If your paper is for Invited Lecture, Please add [Invited Lecture] at the beginning of the title of your paper.

For the papers submitted to Poster Sessions, another format is available. The papers can consist of one cover page and one poster page (two pages in total). The cover page should include the title, each author's information, an abstract of 100 words, and a few keywords.

2. \LaTeX Class File

If you belong to an affiliation in Japan, and your paper is submitted to Poster Sessions of SmartCom 2019 as “TYPE-1 (Isshu-ken) Paper,” please use \LaTeX class file `ieicej.cls` for IEICE Technical Report provided by IEICE. It should be noted that `ieicej.cls` requires Japanese title and author's information. If you do not want to include such information in Japanese, please use `smartcom_type1_nojt.cls` provided by the Organizing Committee of SmartCom 2019.

The class file `smartcom_type1_nojt.cls` provides a header and footer that are same as IEICE Technical Report. The usage of the class file is basically same as the class file `ieicej.cls` for the IEICE Technical Report except for the following points.

- “documentclass” is `smartcom_type1_nojt`.
- Japanese title, sub title, the name of author(s) and affiliation(s) are ignored.

It should be noted that the compile of the source file must

be done by a commande that can handle Japanese (such as `platex`) because the header includes Japanese characters. In some environments, it may be necessary to specify Shift JIS as the character code at compiling the source file like as `platex -kanji=sjis source_filename`.
